

(a) Urban-form model

$n = 79$ $R^2 = 0.28$ $RMSE = 3.5^\circ\text{C}$

extreme ($\geq 41^\circ\text{C}$): false alarms 12, misses 1

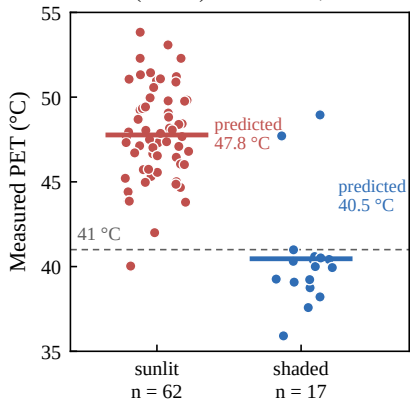

form model: sky, building, tree view factors

- sunlit — direct beam at the sensor
- shaded — no direct beam

(b) Sun/shade model

$n = 79$ $R^2 = 0.54$ $RMSE = 2.8^\circ\text{C}$

extreme ($\geq 41^\circ\text{C}$): false alarms 1, misses 2

Sun/shade read on the panorama
model: prediction = group mean
