

a

Spread within each neighbourhood

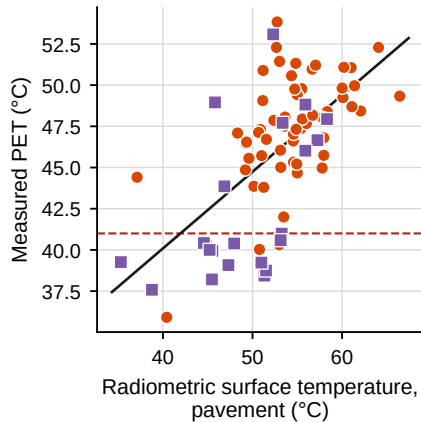

Range (°C) printed above each box. Sorted by date, not by value. All measured 11–14 h except Buam 1 (14:10–15:06, air 37.4 °C, solar elevation 51°), so the columns are not directly comparable.

b T_{mrt} vs. sky view factor

All sites $r = 0.38$. Within neighbourhood $r = 0.31$, permutation $p = 0.007$. With T_s and sun in the model, no longer significant ($p = 0.149$).

c

PET vs. surface temperature

$PET = 21.5 + 0.47 \cdot T_s$. All sites $r = 0.63$. Within neighbourhood $r = 0.51$, permutation $p < 0.001$.

● Measured in sun ($n = 59$) ■ Measured in shade ($n = 21$) - - - Extreme heat stress threshold ($PET \geq 41$ °C)
