

**a**

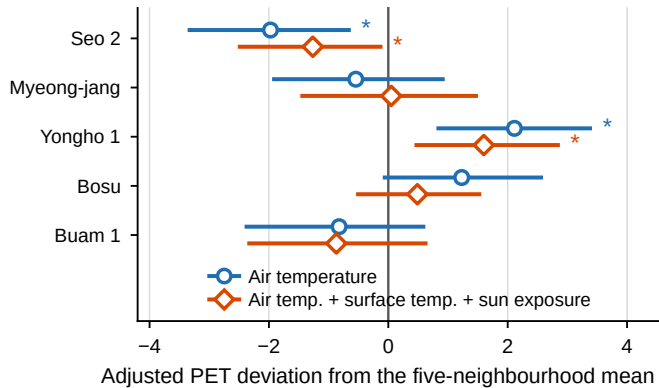

As measured — conditions differ

Each neighbourhood was measured on one day in one time window, so the columns are not comparable as they stand. Buam 1 was measured at 14:10–15:06 (air 37.4 °C, solar elevation 51°); the rest 11–14 h.

**b**

After controlling for measurement conditions

Adjusted PET deviation from the five-neighbourhood mean (°C)

Bars are 95 % bootstrap intervals; \* marks an interval that excludes zero. Only Yongho 1 separates from the others, and 93 % of its sites were sunlit. Time of day cannot be controlled: neighbourhood explains 90 % of its variance.
