

(c) puts every site at one reference condition — 23 Aug 12:30, solar elevation 65°, T_a 35 °C, RH 45 %, wind 1.0 m s⁻¹, clear sky — keeping only its measured form (SVF, tree view) and its sun-or-shade reading, and recomputes PET with the same engine. LCZ 1 was surveyed at 14:10–15:06 (solar elevation 46–56°), the other four near noon (62–67°); once that is removed its shade benefit is no longer the outlier. The engine gives a smaller benefit than the field data (median 3.4 against 5.4 K), so read (c) for the spread between neighbourhoods, not for the level.
