

(a) As measured, all 80 sites

LCZ 1 • Buam 1

12 sunlit / 3 shaded

LCZ 2 • Bosu

12 sunlit / 4 shaded

LCZ 3 • Seo 2

10 sunlit / 7 shaded

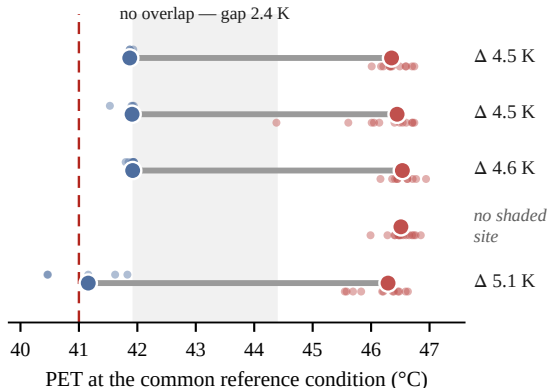

LCZ 4 • Yongho 1

15 sunlit / 0 shaded

LCZ 5 • Myeongjang

12 sunlit / 5 shaded

(b) Same sun, same weather — only the form differs

● sunlit — direct beam at the sensor ● shaded — no direct beam (building, tree or cloud) ○ photo label disagrees with the globe rise (2 sites) - - extreme heat stress, PET 41 °C

(b) puts every site at one reference condition — the campaign medians: 23 Aug 12:30, solar elevation 65°, T_a 35.0 °C, RH 47.6 %, pedestrian wind 0.5 m s⁻¹, clear sky — keeping only its measured sky, tree and building view factors and its sun-or-shade reading, and recomputes PET with the same engine, so that neighbourhoods surveyed on different days and at different hours can be read side by side. The engine gives a smaller sun–shade difference than the field data (median 4.6 against 5.4 K); (b) is therefore read for the comparison between neighbourhoods, not for the absolute level.
