

Distribution of the field measurements (80 sites), by local climate zone
Same site, same minute. Each dot is one site, coloured by local climate zone; black line = median of all sites, band = interquartile range. The bars below each cloud group the sites by zone — thick = interquartile range, thin = full range, white dot = median. View factors re-derived on 2026-09-14 (fisheye stitched, tilted cube-map; 79 sites — one pose failure excluded)

Globe temperature is back-calculated from the globe-derived T_{mrt} (ISO 7726, Ø0.05 m, ϵ 0.95). Tree view factor: median 0.01; 20 of the 79 sites are exactly 0 and 37 round to 0.00 — the sites were chosen without street trees. Pavement temperature: 90th percentile of sunlit pavement; thermal-camera clock offset (+35 min) verified, pairing unchanged.
